Catalog of CHP Technologies, Section 3. Technology

Rapid combustion is a form of combustion, otherwise known as a fire, in which large amounts of heat and light energy are released, which often results in a flame.This is used in a form of machinery such as internal combustion engines and in thermobaric weapons.Such a combustion is frequently called an explosion, though for an internal combustion engine this is inaccurate.

Remember that the pre-requisite of the flow arriving at the valve seat should be that the flow velocity at any rpm maintains atomization of the fuel (fuel remains suspended as a mist in the air and does not "rain out" in big droplets onto the cylinder head wall).The flow in the intake port should not separate and form vortexes before it turns down into the combustion chamber.
